

TANZANIA RANGELAND STUDENT'S ASSOCIATION (TRSA)

The members are practicing one of the ways of controlling tsetsefly (*Glossina* species), this method is known as H Traps, which is designed to catch *Glossina brevipalpis* and *Glossina austeni*. The photo was taken at Mikumi National Park, Tanzania, These are the students from Sokoine University of Agriculture, Morogoro Tanzania taking BSc in Range Management the 3rd year (2018-2019).

Here the TRSA members with their instructor (In front Dr. A, Z. Sangeda) are training the pastoralists on hay bales making around the villages where conflicts between the farmers and the pastoralists usually exist, at Morogoro Region, Tanzania. This is among of the ways of reducing conflicts among the victims.

One of the step is to fill the wooden box with the grasses and tie them tightly to avoid the dispersion of the grasses.

One of the activities performed by The TRSA members, on learning and sharing knowledge with the farmers on how to establish pasture for their livestock. Here are some members with their instructor; training some of the farmers on how to establish *Cenchrus ciliaris* (African foxtail grasses) pasture at Manyara Region in Tanzania.
